

# {ggstatsplot}: Informative Statistical Visualizations

Indrajeet Patil

# Why `{ggstatsplot}`?

Current CRAN package count >23,000

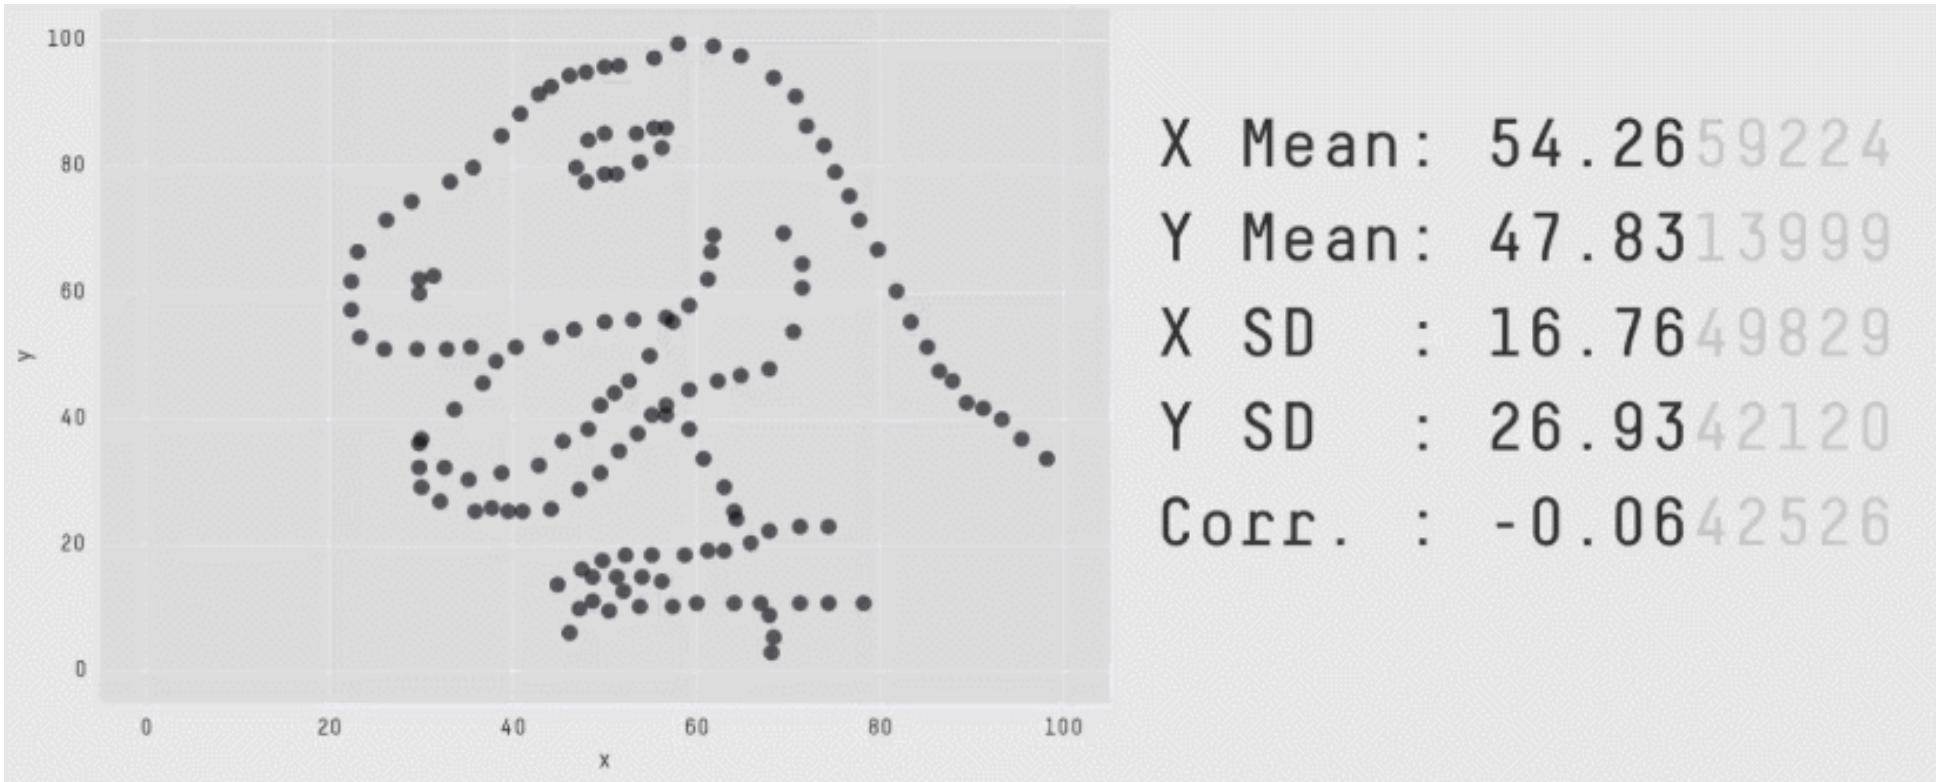

`{ggstatsplot}` provides

📊 information-rich plots with statistical details

✍️ suitable for faster (exploratory) data analysis and reporting

# Informative graphic = a thousand words

Graphical summaries can reveal problems not visible from numerical statistics.

# Ready-made plot = no customization

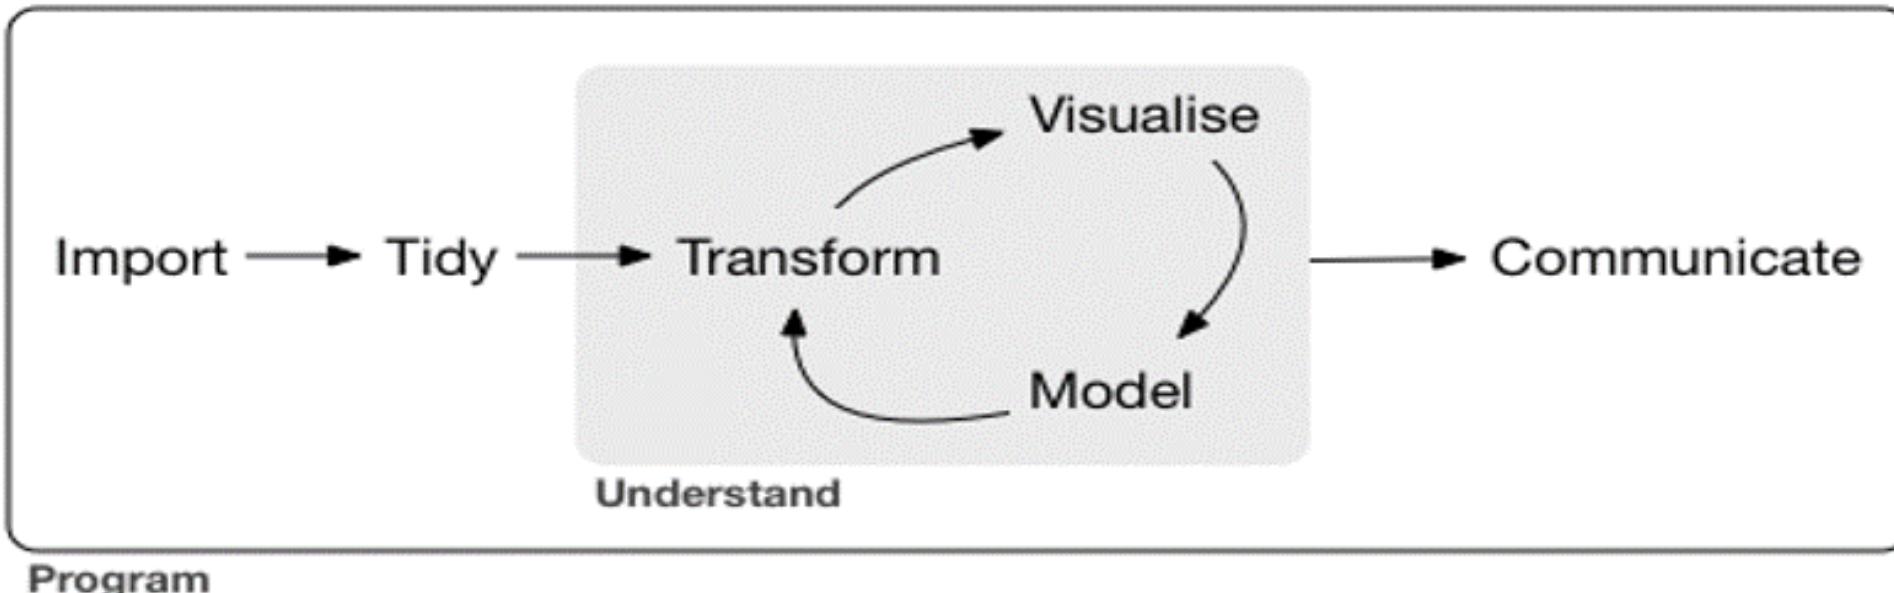

The grammar of graphics is a powerful framework ([Wilkinson, 2011](#)) and can help you make *any* graphics fitting your specific data visualization needs! But...

Quality of Life (QoL) improvements with `{ggstatsplot}`

Provide ready-made plots with defaults following the best practices in statistical reporting and data visualization.

# Simpler/faster data analysis workflow

In a typical *exploratory* data analysis workflow, **data visualization** and **statistical modeling** are two different phases: visualization informs modeling, and modeling can suggest a different visualization, and so on and so forth.

Central idea of `{ggstatsplot}`

Simple: combine these two phases into one!

# And a LOT more!

...but we will come back to that later 

Let's get started first!

Package available for installation on CRAN and GitHub:

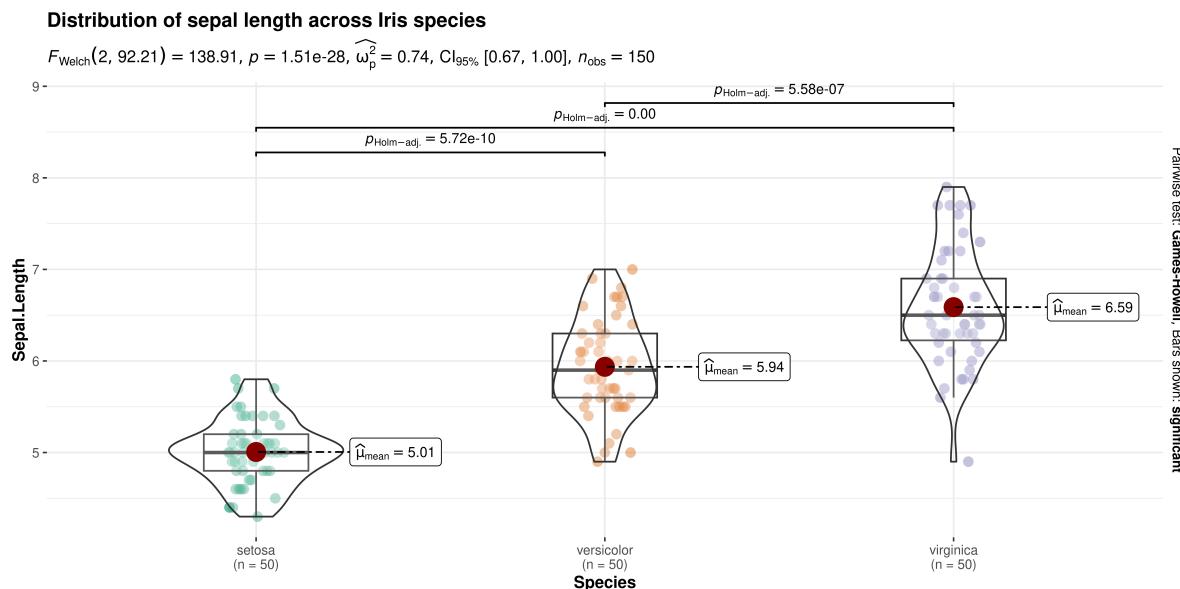

Type	Command
Release	<code>install.packages("ggstatsplot")</code>
Development	<code>pak::pak("IndrajeetPatil/ggstatsplot")</code>

# Example function

## ggbetweenstats()

For between-group comparisons

```
1 ggbetweenstats(  
2   data = iris,  
3   x     = Species,  
4   y     = Sepal.Length,  
5   title = "Distribution of sepal length across Iris species"  
6 )
```

### ! Important

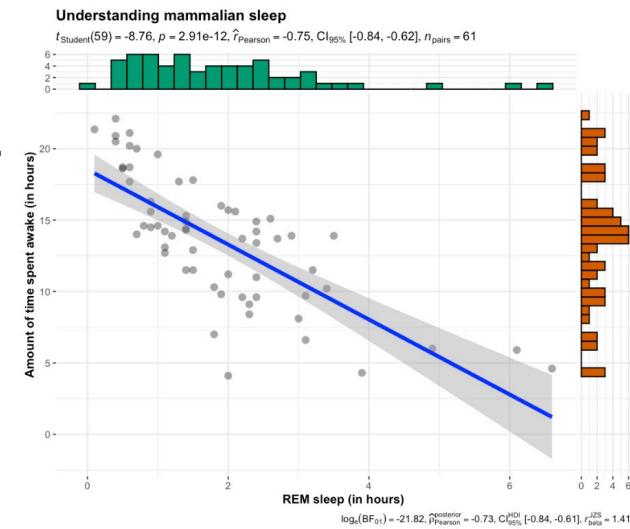

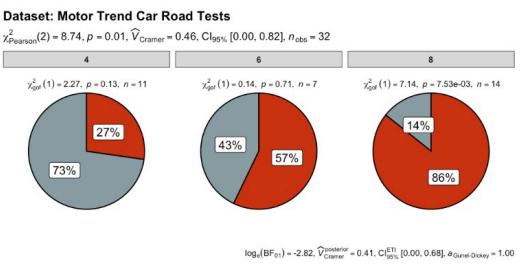

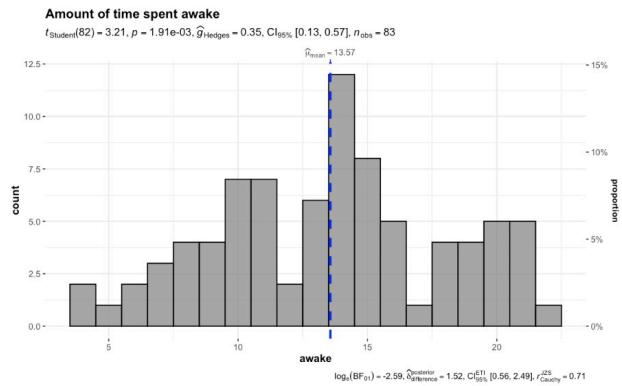

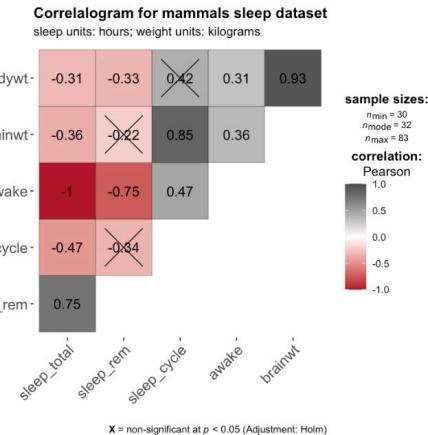

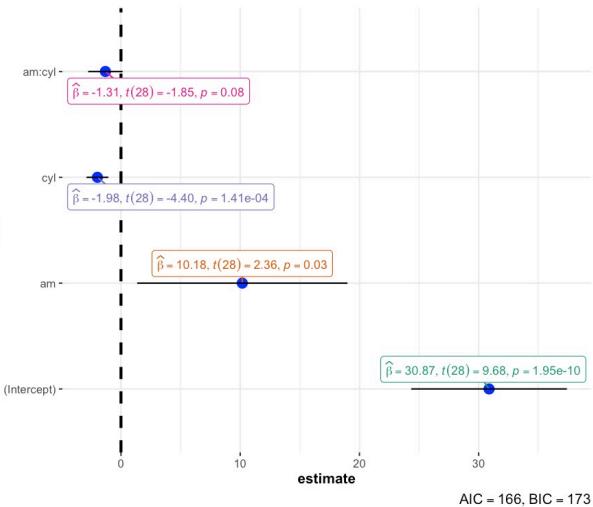

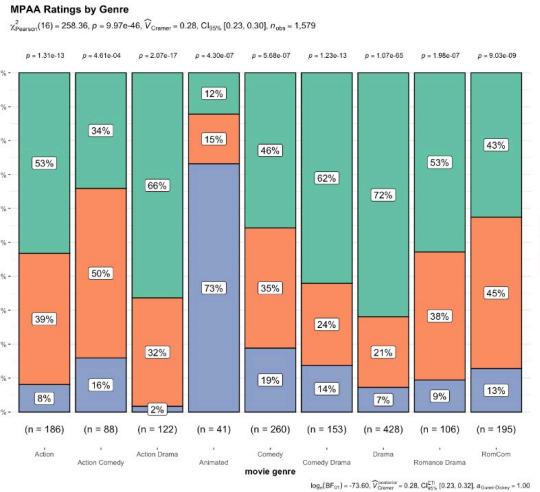

### Defaults

- raw data + distributions
- descriptive statistics
- inferential statistics
- effect size + uncertainty
- pairwise comparisons
- Bayesian hypothesis-testing
- Bayesian estimation

### Statistical approaches available

- parametric
- parametric
- robust
- Bayesian

# Other functions

# Benefits for Statistical Reporting

# Results *in context* of the data

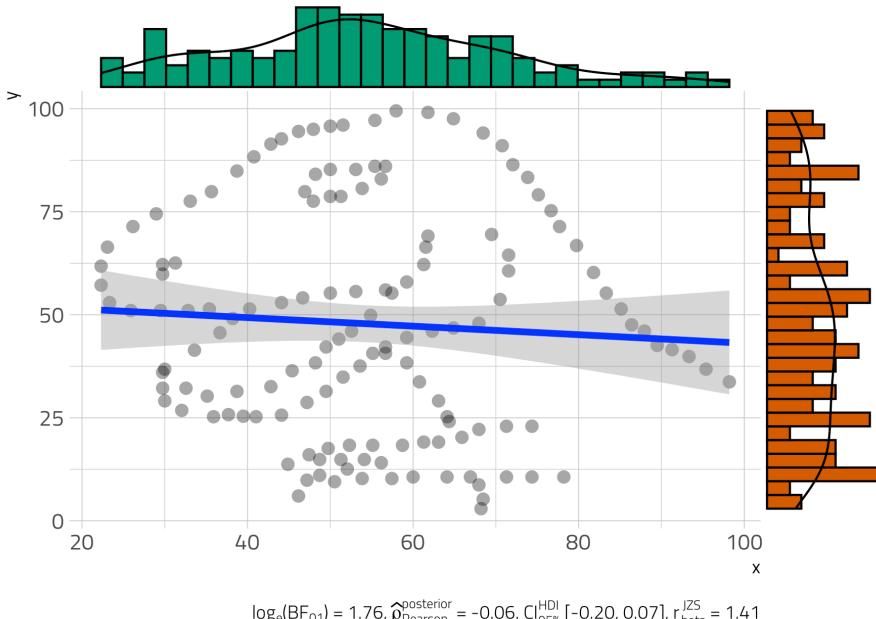

## Standard approach

Pearson's correlation test revealed that, across 142 participants, variable  $\text{x}$  was negatively correlated with variable  $\text{y}$ :  $t(140) = -0.76, p = .446$ . The effect size ( $r = -0.06, 95\%CI[-.23, .10]$ ) was small, as per Cohen's (1988) conventions. The Bayes Factor for the same analysis revealed that the data were 5.81 times more probable under the null hypothesis as compared to the alternative hypothesis. This can be considered moderate evidence (Jeffreys, 1961) in favor of the null hypothesis (absence of any correlation between  $\text{x}$  and  $\text{y}$ ).

## {ggstatsplot} approach

Relationship between  $x$  and  $y$

$t_{\text{Student}}(140) = -0.76, p = 0.446, \hat{r}_{\text{Pearson}} = -0.06, \text{CI}_{95\%} [-0.23, 0.10], n_{\text{pairs}} = 142$

# Toggling statistical approaches

## Parametric

```
1 # anova
2 ggbetweenstats(
3   data = mtcars,
4   x = cyl,
5   y = wt,
6   type = "p"
7 )
8
9 # correlation analysis
10 ggscatterstats(
11   data = mtcars,
12   x = wt,
13   y = mpg,
14   type = "p"
15 )
16
17 # t-test
18 gghistostats(
19   data = mtcars,
20   x = wt,
21   test.value = 2,
22   type = "p"
23 )
```

## Non-parametric

```
1 # anova
2 ggbetweenstats(
3   data = mtcars,
4   x = cyl,
5   y = wt,
6   type = "np"
7 )
8
9 # correlation analysis
10 ggscatterstats(
11   data = mtcars,
12   x = wt,
13   y = mpg,
14   type = "np"
15 )
16
17 # t-test
18 gghistostats(
19   data = mtcars,
20   x = wt,
21   test.value = 2,
22   type = "np"
23 )
```

# Alternative to painful workflow

## Load 'em up!

- 📦 for inferential statistics (e.g. `stats`)
- 📦 computing effect size + CIs (e.g. `effectsize`)
- 📦 for descriptives (e.g. `skimr`)
- 📦 pairwise comparisons (e.g. `multcomp`)
- 📦 Bayesian hypothesis testing (e.g. `BayesFactor`)
- 📦 Bayesian estimation (e.g. `bayestestR`)
- 📦 .

## Things to worry about 😕

- 😕 accepts dataframe, vector, matrix?
- 😕 long/wide format data?
- 😕 works with `NAs`?
- 😕 returns list, dataframe, arrays?
- 😕 works with tibbles?
- 😕 has all necessary details?
- 😕 .

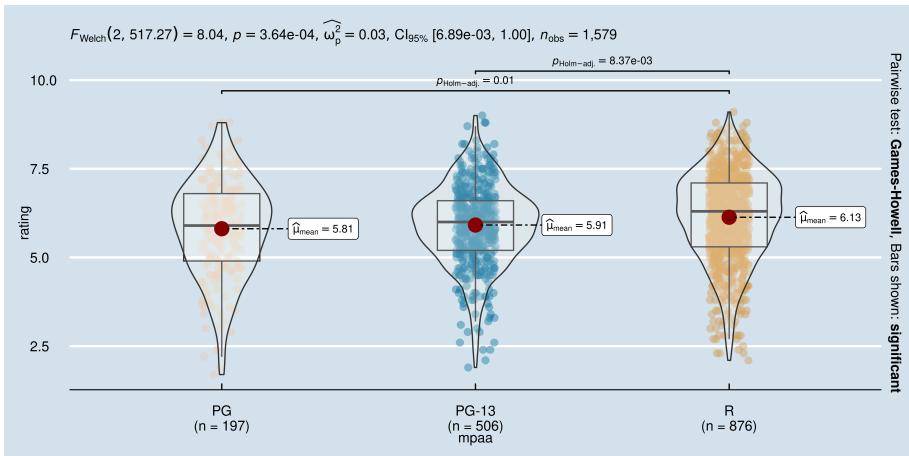

# Plot Customizability

“What if I don’t like the default plots?” 

# Changing aesthetics

```
1 ggbetweenstats(  
2   data = movies_long,  
3   x = mpaa,  
4   y = rating,  
5   ggtheme = ggthemes::theme_economist(),  
6   palette = "Darjeeling2",  
7   package = "wesanderson"  
8 )
```

Aesthetic preferences not an excuse to avoid `{ggstatsplot}`! 😺 Any `ggplot` theme or palette can be used.

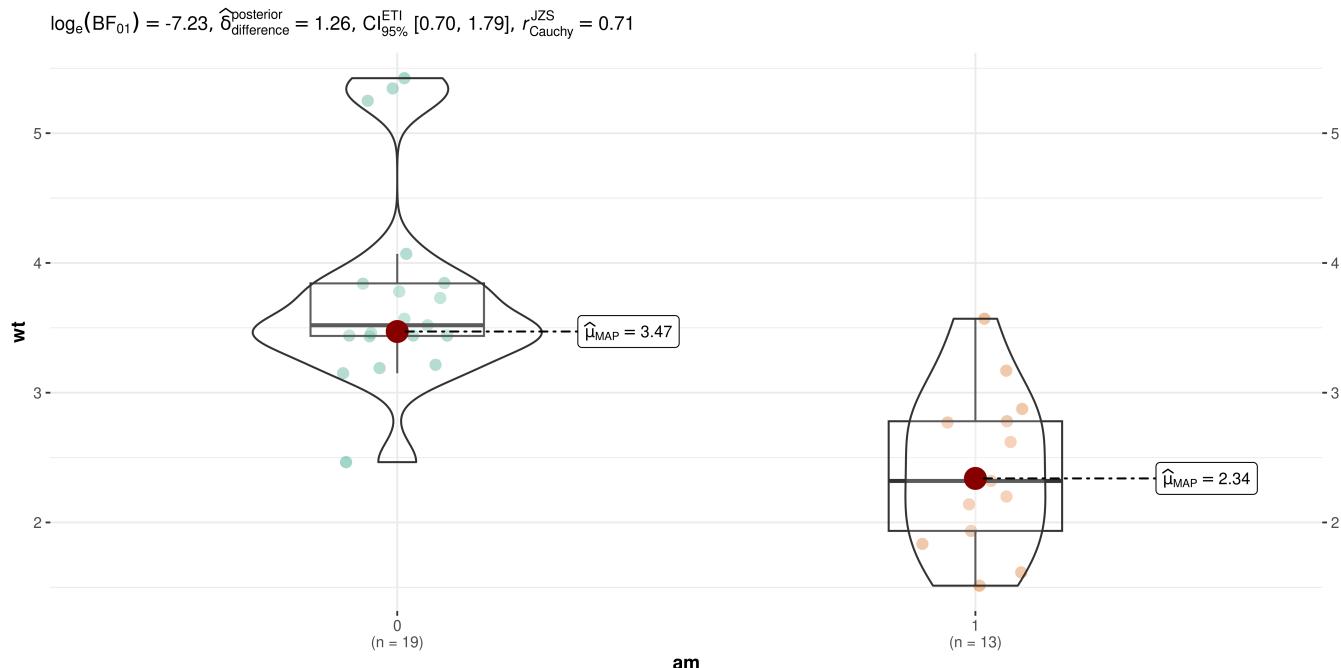

N.B. The default palette is **colorblind-friendly**.

# Modification with

{ggplot2} 

You can modify `{ggstatsplot}` plots further using `{ggplot2}` functions. 

```
1 ggbetweenstats(  
2   data = mtcars,  
3   x = am,  
4   y = wt,  
5   type = "bayes"  
6 ) +  
7   scale_y_continuous(sec.axis = dup_axis())
```

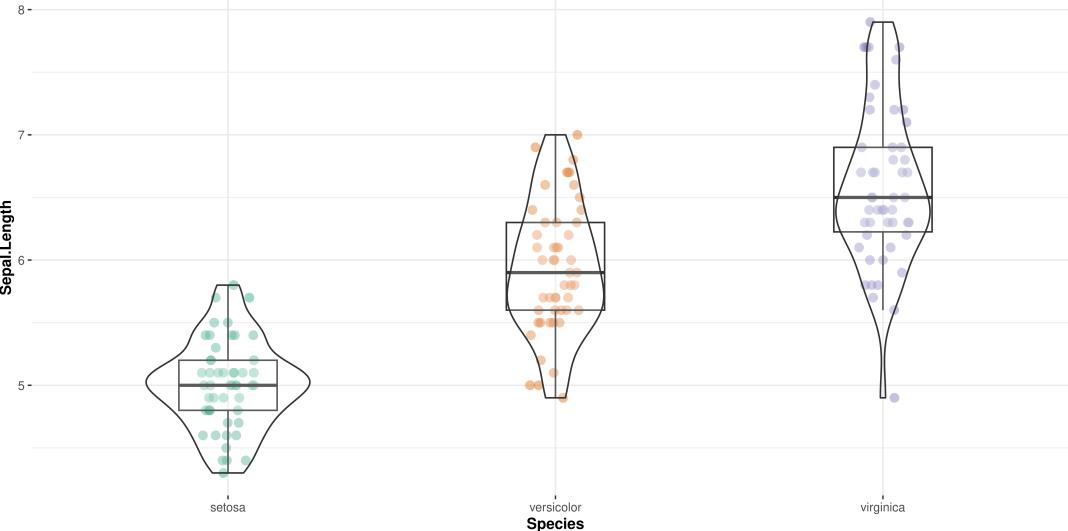

# Too much information

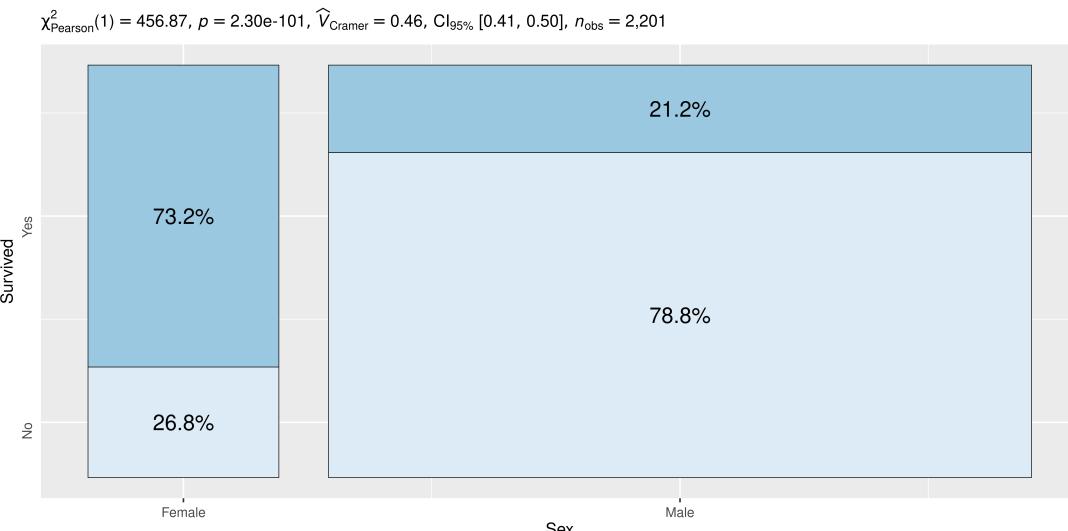

Get only plots:

```
1 ggbetweenstats(
2   data = iris,
3   x = Species,
4   y = Sepal.Length,
5   # turn off statistical analysis
6   centrality.plotting = FALSE,
7   results.subtitle = FALSE,
8   bf.message = FALSE,
9   # turn off pairwise comparisons
10  pairwise.display = "none"
11 )
```

Get only expressions:

```
1 stats_expr <- ggpiestats(
2   Titanic_full, Survived, Sex,
3 ) %>% extract_subtitle()
4
5 ggiraphExtra::ggSpine(
6   data = Titanic_full,
7   aes(x = Sex, fill = Survived)
8 ) +
9   labs(subtitle = stats_expr)
```

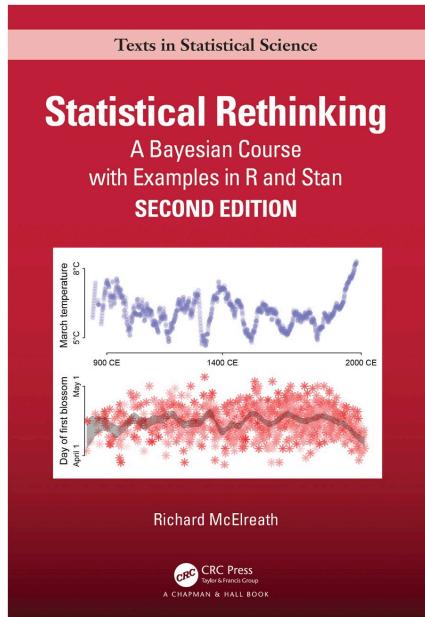

# Negatives

# “Golem of Prague” issue

Promotes mindless application of statistical tests.

Easy-to-use software can lead to misuse.

## Clunky API

- Too many arguments to remember.
- Not a “real” `{ggplot2}` extension.
- Limited number of functions.
- Non-trivial statistical proficiency needed.

# Positives

# Quality Assurance

Each commit must pass many QA checks:

## ⓘ CI Checks (GitHub Actions)

- Unit tests (random-order)
- Code coverage (100%)
- Linting (0 lints)
- Formatting (0 issues)
- Documentation (website, link rot, examples)
- CRAN checks (0 E, 0 W, 0 N)
- Pre-commit hooks (0 issues)
- Portability (Linux, macOS, Windows)
- Robustness (dependencies, R versions)

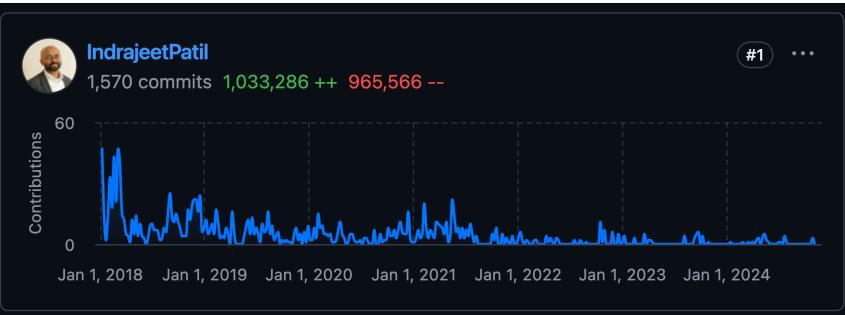

All checks have passed  
24 successful checks

Show all checks

Healthy and active code base

Lessons learned while  
refactoring {ggstatsplot} 📦

Going from 20K to ~1.5K lines of  
code

Visualizations with statistical details: The 'ggstatsplot' approach

Indrajeet Patil<sup>1</sup>

<sup>1</sup> Center for Humans and Machines, Max Planck Institute for Human Development, Berlin, Germany

### Summary

Graphical displays can reveal problems in a statistical model that might not be apparent from purely numerical summaries. Such visualizations can also be helpful for the reader to evaluate the validity of a model if it is reported in a scholarly publication or report. But, given the onerous costs involved, researchers often avoid preparing information-rich graphics and exploring several statistical approaches or tests available. The *ggstatsplot* package in the R programming language (R Core Team, 2021) provides a one-line syntax to enrich *ggplot2*-based visualizations with the results from statistical analysis embedded in the visualization itself. In doing so, the package helps researchers adopt a rigorous, reliable, and robust data exploratory and reporting workflow.

Journal of Open Source Software 6 (61),  
3167, 2021

# Conclusion

# Exploring data made easy! 😊

In summary, the `ggstatsplot` approach-

- (a) avoids errors in statistical reporting,
- (b) highlights the importance of the effect by providing effect size measures by default,
- (c) provides an easy way to evaluate *absence* of an effect using Bayesian framework,
- (d) demands to evaluate statistical analysis in the context of the underlying data, and is
- (e) easy and (f) simple enough that somebody with little coding experience can use it without making an error.

# Appendix

# Examples of other functions

## ggwithinstats()

### Hypothesis about group differences: repeated measures design

```
1 ggwithinstats(  
2   data = WRS2::WineTasting,  
3   x = Wine,  
4   y = Taste  
5 )
```

#### ! Important

#### Defaults

- raw data + distributions
- descriptive statistics
- inferential statistics
- effect size + uncertainty
- pairwise comparisons
- Bayesian hypothesis-testing
- Bayesian estimation

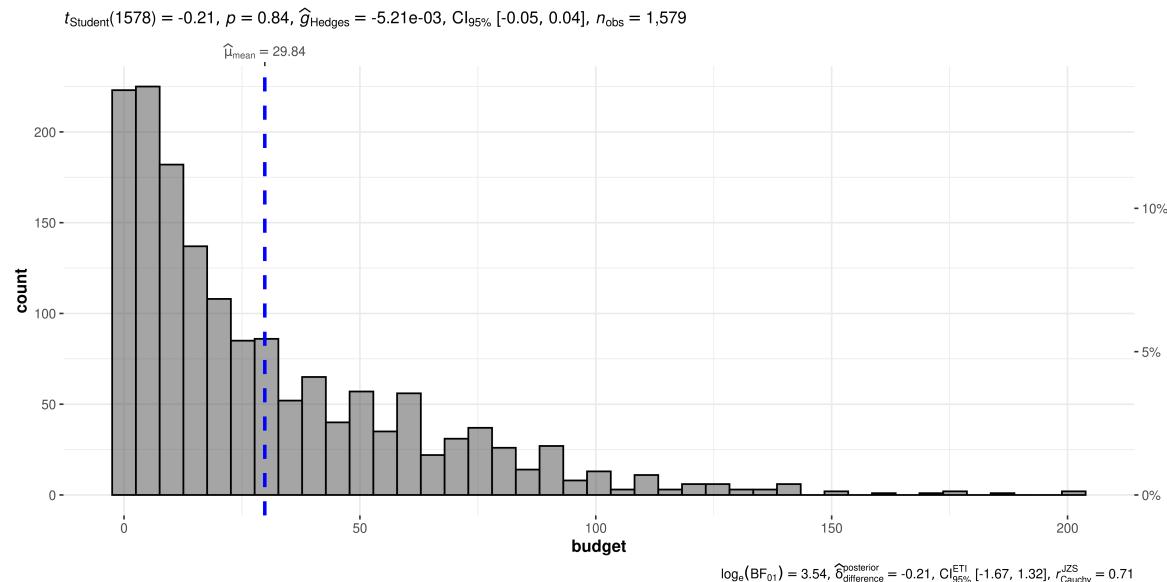

#### Statistical approaches available

- parametric
- parametric
- robust
- Bayesian

## gghistostats()

### Distribution of a numeric variable

```
1 gghistostats(  
2   data = movies_long,  
3   x = budget,  
4   test.value = 30  
5 )
```

#### ! Important

#### 💡 Defaults

- counts + proportion for bins
- descriptive statistics
- inferential statistics
- effect size + uncertainty
- pairwise comparisons
- Bayesian hypothesis-testing
- Bayesian estimation

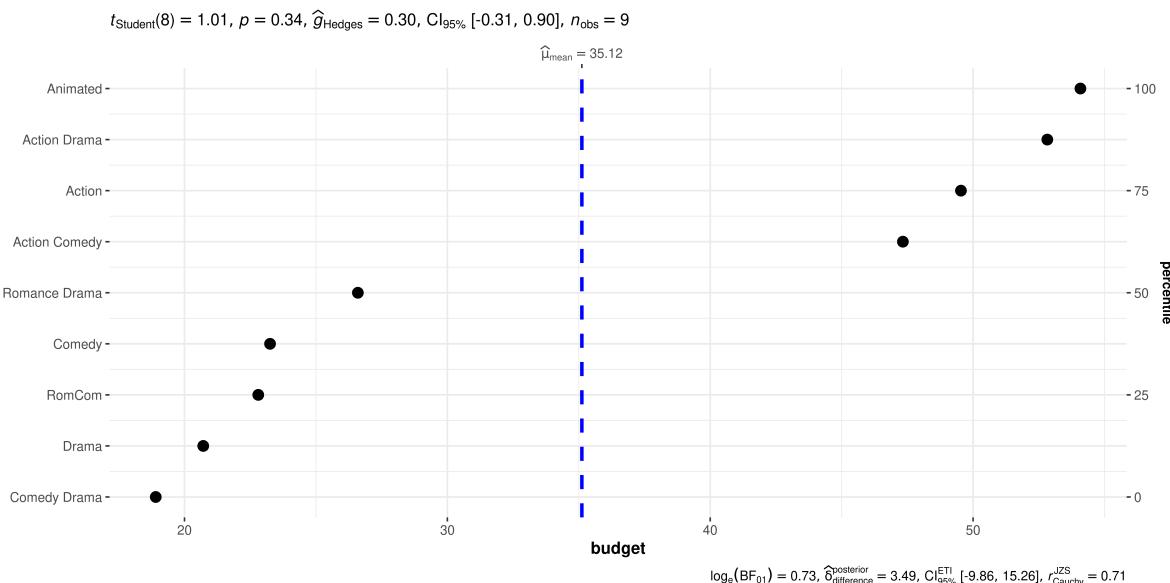

#### Statistical approaches available

- parametric
- parametric
- robust
- Bayesian

## ggdotplotstats()

### Labeled numeric variable

```
1 ggdotplotstats(  
2   data = movies_long,  
3   x = budget,  
4   y = genre,  
5   test.value = 30  
6 )
```

#### ! Important

#### Defaults

- descriptive statistics
- inferential statistics
- effect size + uncertainty
- pairwise comparisons
- Bayesian hypothesis-testing
- Bayesian estimation

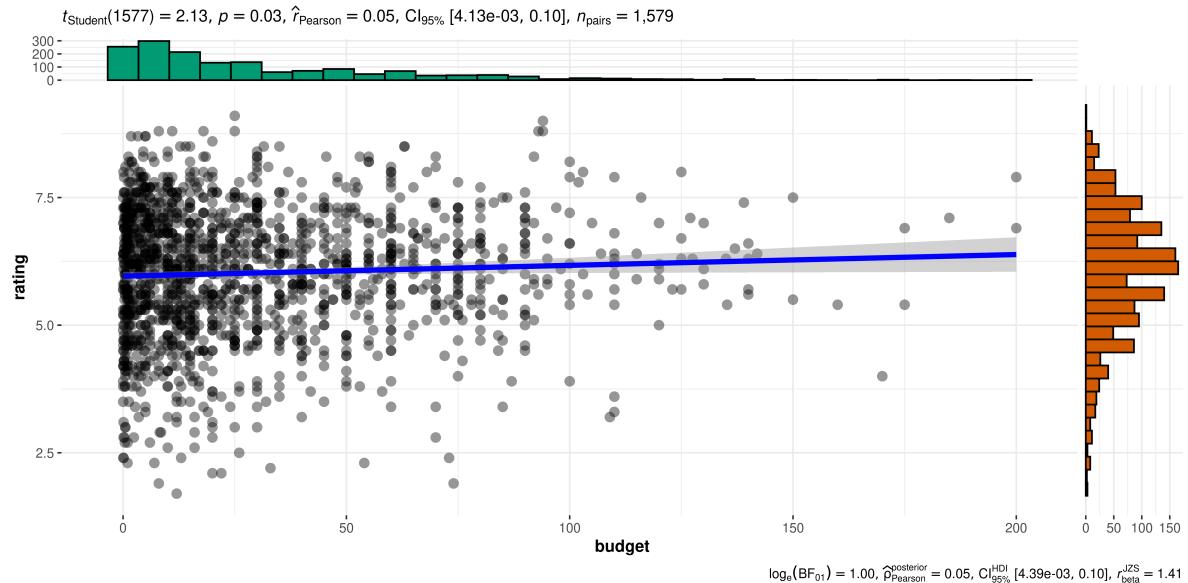

#### Statistical approaches available

- parametric
- parametric
- robust
- Bayesian

## ggscatterstats()

Hypothesis about correlation: Two numeric variables

```
1 ggscatterstats(  
2   data = movies_long,  
3   x = budget,  
4   y = rating  
5 )
```

### ! Important

### Defaults

- joint distribution
- marginal distribution
- effect size + uncertainty
- pairwise comparisons
- Bayesian hypothesis-testing
- Bayesian estimation

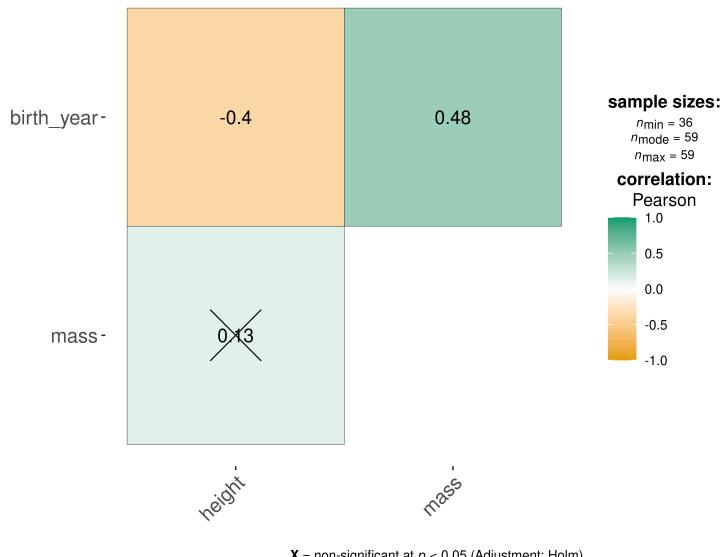

### Statistical approaches available

- parametric
- nonparametric
- robust
- Bayesian

## ggcorrmat()

### Hypothesis about correlation: Multiple numeric variables

```
1 ggcorrmat(dplyr::starwars)
```

#### ! Important

#### 📝 Defaults

- inferential statistics
- effect size + uncertainty
- careful handling of NAs
- partial correlations

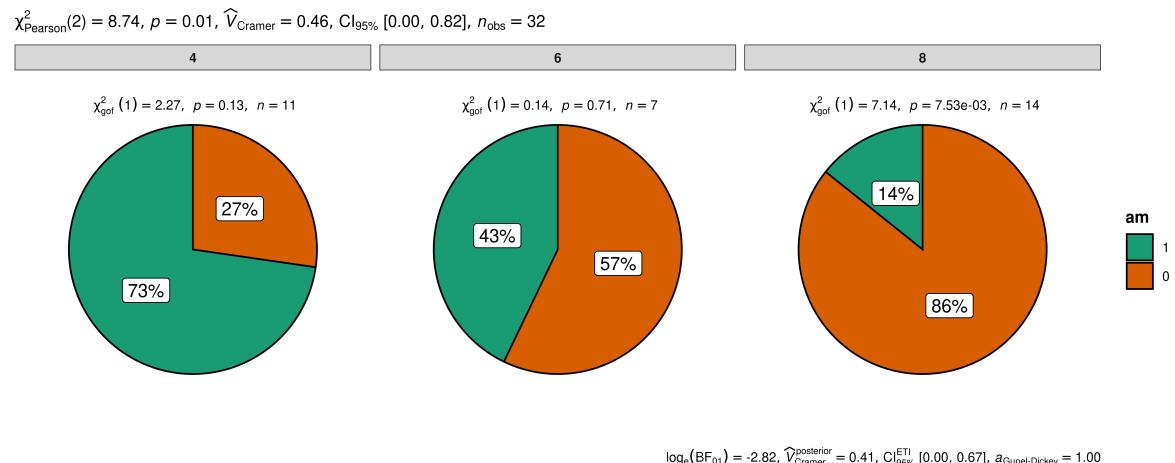

#### Statistical approaches available

- parametric
- parametric
- robust
- Bayesian

## ggpiestats()

### Hypothesis about composition of categorical variables

```
1 ggpiestats(  
2   data = mtcars,  
3   x = am,  
4   y = cyl  
5 )
```

#### ! Important

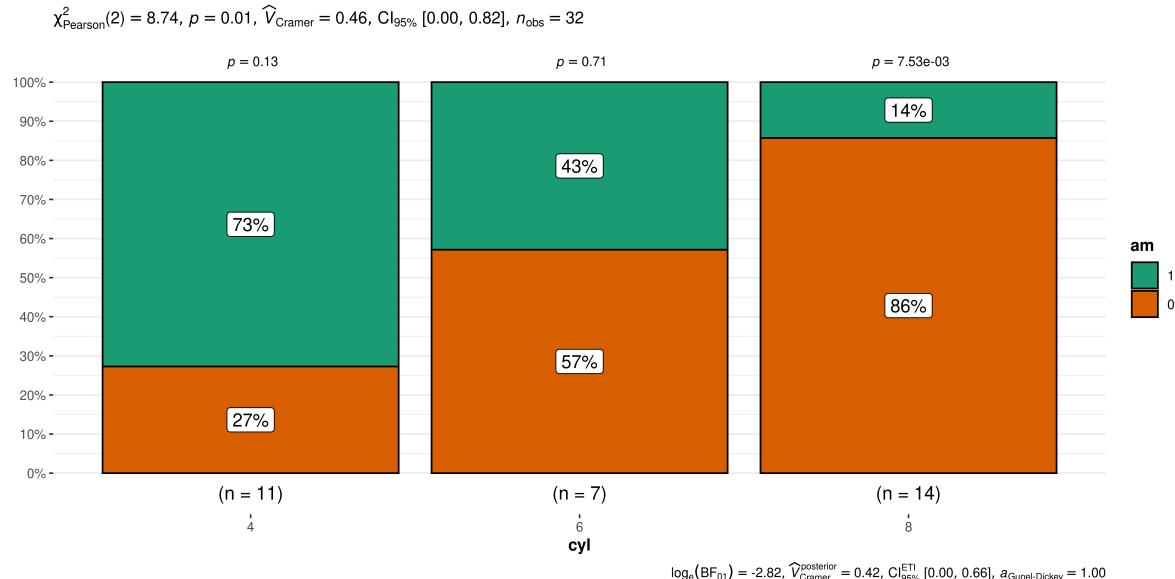

#### Defaults

- descriptive statistics
- inferential statistics
- effect size + uncertainty
- goodness-of-fit tests
- Bayesian hypothesis-testing
- Bayesian estimation

## ggbarstats()

### Hypothesis about composition of categorical variables

```
1 ggbarstats(  
2   data = mtcars,  
3   x = am,  
4   y = cyl  
5 )
```

#### ! Important

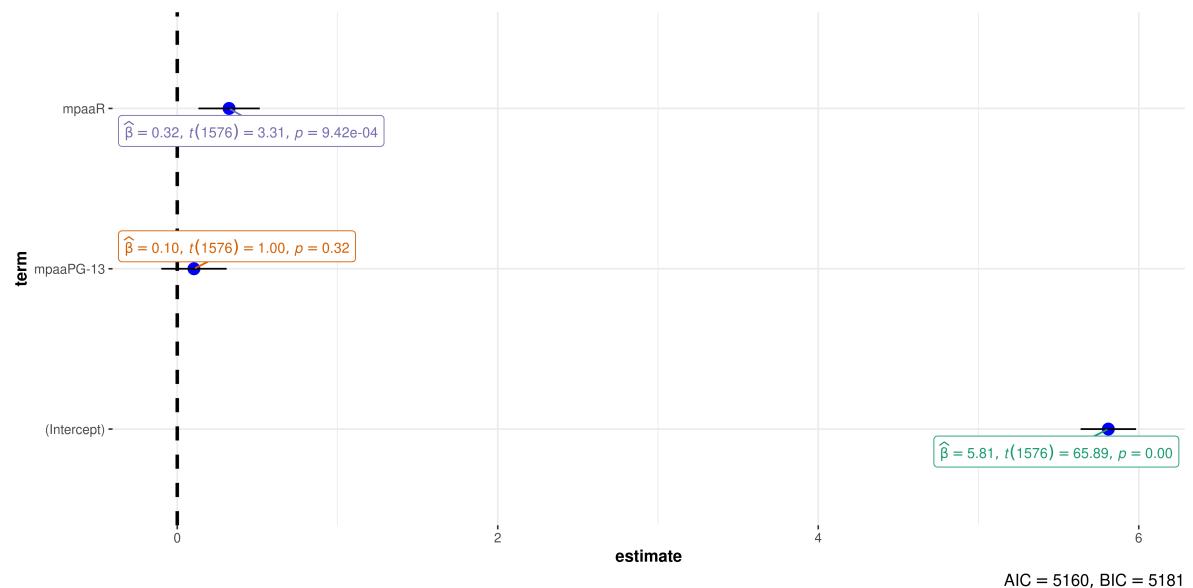

#### Defaults

- descriptive statistics
- inferential statistics
- effect size + uncertainty
- goodness-of-fit tests
- Bayesian hypothesis-testing
- Bayesian estimation

## ggcoefstats()

### Hypothesis about regression coefficients

```
1 mod <- lm(  
2   formula = rating ~ mpaa,  
3   data = movies_long  
4 )  
5  
6 ggcoefstats(mod)
```

#### ! Important

#### Defaults

- estimate + uncertainty
- inferential statistics ( $t, z, F, \chi^2$ )
- model fit indices (AIC + BIC)

Supports all regression models supported in `{easystats}` ecosystem.

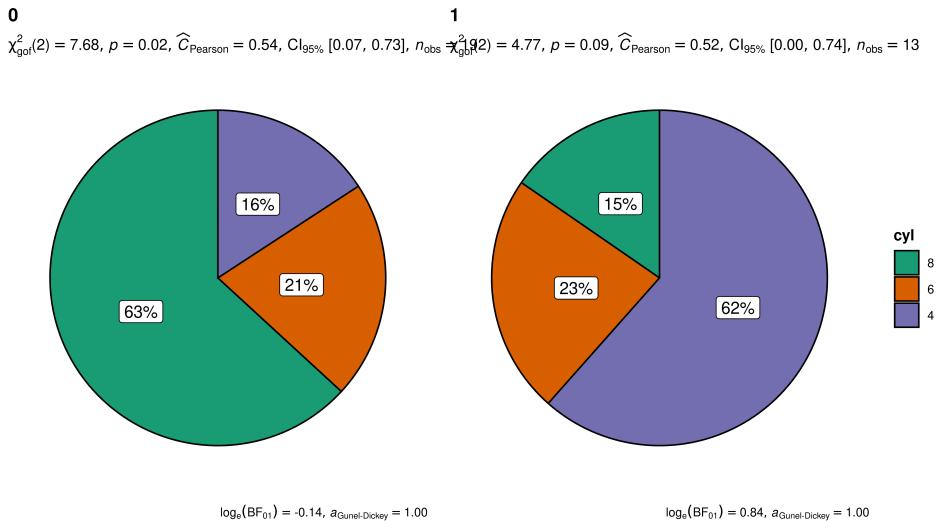

Meta-analysis is also supported!

# *grouped\_* variants

Iterating over a grouping variable

# *grouped\_* functions

```
1 grouped_ggpiestats(  
2   data = mtcars,  
3   x = cyl,  
4   grouping.var = am  
5 )
```

## Available *grouped\_* variants:

- `grouped_ggbetweenstats()`
- `grouped_ggwithinstats()`
- `grouped_gghistostats()`
- `grouped_ggdotplotstats()`
- `grouped_ggscatterstats()`
- `grouped_ggcorrmat()`
- `grouped_ggpiestats()`
- `grouped_ggbarstats()`

More `{ggstatsplot}` benefits

# Supports different statistical approaches

# Best practices in statistical reporting

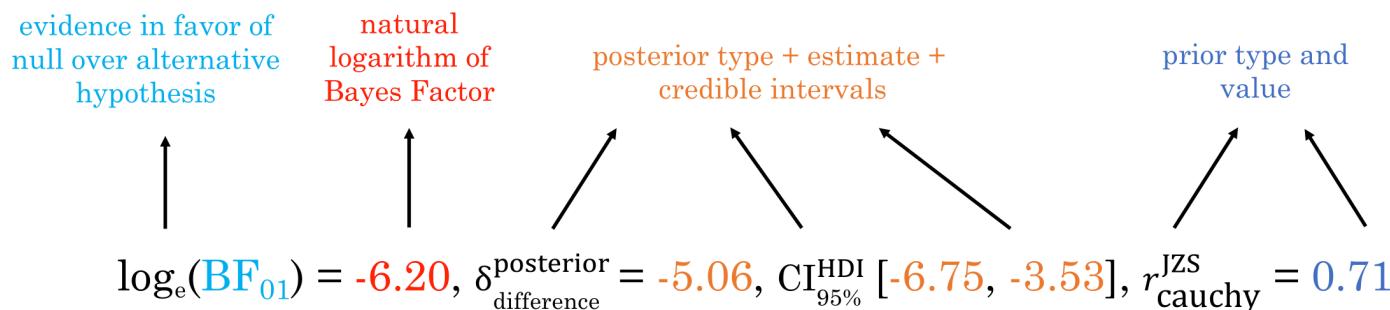

Results from Welch's t-test with {statsExpressions}

## Template for Frequentist analysis

## Template for Bayesian analysis

<<https://indrajeetpatil.github.io/statsExpressions/>>

src: @patilindrajeets

# Avoiding reporting errors

“half of all published psychology papers that use NHST contained at least one  $p$ -value that was inconsistent with its test statistic and degrees of freedom. One in eight papers contained a grossly inconsistent  $p$ -value that may have affected the statistical conclusion”

(Nuijten et al., *Behavior Research Methods*, 2016)

Since the plot and the statistical analysis are yoked together, the chances of making an error in reporting the results are minimized.

No need to worry about updating figures and statistical details **separately**. 

# Making sense of null results

$p > 0.05$ : The null hypothesis ( $H_0$ ) can't be rejected

But can it be **accepted**?! Null Hypothesis Significance Testing 😬

“In 72% of cases, nonsignificant results were misinterpreted, in that the authors inferred that the effect was absent. A Bayesian reanalysis revealed that fewer than 5% of the nonsignificant findings provided strong evidence (i.e.,  $BF_{01} > 10$ ) in favor of the null hypothesis over the alternative hypothesis.”

(Aczel et al., AMPPS, 2018)

Juxtaposing frequentist and Bayesian statistics for the same analysis helps to properly interpret the null results.

# A few other benefits

Minimal code needed (`data`, `x`, `y`): minimizes chances of error + tidy scripts. 🎉

Disembodied figures stand on their own and are easy to evaluate. 😊

More breathing room for theoretical discussion and other text. ✍️

# Misconceptions: This package is...

-  an alternative to learning `ggplot2`
-  the more you know `ggplot2`, the better you can modify the defaults to your liking)
  
-  meant to be used in talks/presentations
-  defaults too complicated for effectively communicating results in time-constrained presentation settings, e.g. conference talks)
  
-  only relevant when used in publications
-  not necessary; can also be useful *only* during exploratory phase
  
-  the only game in town
-  excellent GUI open-source software: `JASP` and `jamovi`)
